AGENDA :

- Practical Motivation & Problem Definiton
- Data Preparation
- Exploratory Data Analysis
- Classification Model - Decision Trees
- Prediction of Diabetes Type, Risk of DKA and Risk of Hypertension
- Optimisation Model - Random Forest
- Deep Learning

WHAT IS DIABETES?

Diabetes is a **chronic metabolic disorder** characterized by **elevated levels of glucose** (sugar) in the bloodstream. It occurs when the body either cannot produce enough insulin (a hormone that regulates blood sugar levels) or cannot use insulin effectively. Insulin is crucial for allowing glucose to enter cells and be used for energy.

About Dataset

This dataset is originally from the National Institute of Diabetes and Digestive and Kidney Diseases. The objective of the dataset is to diagnostically predict whether a patient has diabetes, based on certain diagnostic measurements included in the dataset. Several constraints were placed on the selection of these instances from a larger database. In particular, all patients here are females at least 21 years old of Pima Indian heritage.2
From the data set in the (.csv) File We can find several variables, some of them are independent (several medical predictor variables) and only one target dependent variable (Outcome).

PROBLEM DEFINITION

- Determination of type of Diabetes
- Prediction DKA Risk
- Prediction of Hypertension Risk

DATA PREPARATION & CLEANING

Removing irrelevant columns

```python
# List of columns to remove
columns_to_remove = ['SkinThickness', 'Age']

# Drop the specified columns
cleaned_df = thedata.drop(columns=columns_to_remove)
cleaned_df.head()
```

	Pregnancies	Glucose	BloodPressure	Insulin	BMI	DiabetesPedigreeFunction	Outcome	Type
0	6	148	72	0	33.6	0.627	1	0
1	1	85	66	0	26.6	0.351	0	0
2	8	183	64	0	23.3	0.672	1	0
3	1	89	66	94	28.1	0.167	0	0
4	0	137	40	168	43.1	2.288	1	0

Missing values

```
Pregnancies                 0
Glucose                     0
BloodPressure               0
Insulin                     0
BMI                         0
DiabetesPedigreeFunction    0
Outcome                     0
dtype: int64
```

Diabetes treatment: Using insulin to manage blood sugar

Learning how insulin affects your blood sugar can help you better manage your condition.

By Mayo Clinic Staff

Insulin therapy often is an important part of diabetes treatment. It helps keep blood sugar under control and prevents diabetes complications. It works like the hormone insulin that the body usually makes.

Glucose X Outcome

```

```
Accuracy score (test):  0.7241379310344828
```

[33]:
```
# evaluating the model for train set
y_pred_train= model.predict(xtrain)
y_pred_train= [0 if val<0.5 else 1 for val in y_pred_train]
```

```
21/21 [==============================] - 0s 2ms/step
```

[34]:
```
# checking the accuracy score for the train dataset
print("Accuracy score (test): " , accuracy_score(ytrain,y_pred_train))
```

```
Accuracy score (test):  0.8773006134969326
```

DEEP LEARNING

CONCLUSION

- We began by investigating the dataset with EDA
- Classification techniques helped determine the contribution of each factor
- Random forest helped us recognise that Glucose is the key factor
- Created a deep learning model
- Accuracy scores for DL model were higher than what we obtained in classification
- With more refinement outcomes can be improved drastically
